

LM20

LM20 2.4V, 10 μ A, SC70, micro SMD Temperature Sensor

Literature Number: SNIS106O

LM20

2.4V, 10µA, SC70, micro SMD Temperature Sensor

General Description

The LM20 is a precision analog output CMOS integrated-circuit temperature sensor that operates over a -55°C to $+130^{\circ}\text{C}$ temperature range. The power supply operating range is $+2.4\text{ V}$ to $+5.5\text{ V}$. The transfer function of LM20 is predominately linear, yet has a slight predictable parabolic curvature. The accuracy of the LM20 when specified to a parabolic transfer function is $\pm 1.5^{\circ}\text{C}$ at an ambient temperature of $+30^{\circ}\text{C}$. The temperature error increases linearly and reaches a maximum of $\pm 2.5^{\circ}\text{C}$ at the temperature range extremes. The temperature range is affected by the power supply voltage. At a power supply voltage of 2.7 V to 5.5 V the temperature range extremes are $+130^{\circ}\text{C}$ and -55°C . Decreasing the power supply voltage to 2.4 V changes the negative extreme to -30°C , while the positive remains at $+130^{\circ}\text{C}$.

The LM20's quiescent current is less than $10\text{ }\mu\text{A}$. Therefore, self-heating is less than 0.02°C in still air. Shutdown capability for the LM20 is intrinsic because its inherent low power consumption allows it to be powered directly from the output of many logic gates or does not necessitate shutdown at all.

Applications

- Cellular Phones
- Computers
- Power Supply Modules
- Battery Management

- FAX Machines
- Printers
- HVAC
- Disk Drives
- Appliances

Features

- Rated for full -55°C to $+130^{\circ}\text{C}$ range
- Available in an SC70 and micro SMD package
- Predictable curvature error
- Suitable for remote applications

Key Specifications

■ Accuracy at $+30^{\circ}\text{C}$	± 1.5 to $\pm 4^{\circ}\text{C}$ (max)
■ Accuracy at $+130^{\circ}\text{C}$ & -55°C	± 2.5 to $\pm 5^{\circ}\text{C}$ (max)
■ Power Supply Voltage Range	$+2.4\text{ V}$ to $+5.5\text{ V}$
■ Current Drain	$10\text{ }\mu\text{A}$ (max)
■ Nonlinearity	$\pm 0.4\%$ (typ)
■ Output Impedance	$160\text{ }\Omega$ (max)
■ Load Regulation	-2.5 mV (max)
$0\text{ }\mu\text{A} < I_L < +16\text{ }\mu\text{A}$	

Typical Application

**Full-Range Celsius (Centigrade) Temperature Sensor (-55°C to $+130^{\circ}\text{C}$)
Operating from a Single Li-Ion Battery Cell**

$$V_O = (-3.88 \times 10^{-6} \times T^2) + (-1.15 \times 10^{-2} \times T) + 1.8639$$

$$T = -1481.96 + \sqrt{2.1962 \times 10^6 + \frac{(1.8639 - V_O)}{3.88 \times 10^{-6}}}$$

where:

T is temperature, and V_O is the measured output voltage of the LM20.

10090824

Temperature (T)	Typical V_O
+130°C	+303 mV
+100°C	+675 mV
+80°C	+919 mV
+30°C	+1515 mV
+25°C	+1574 mV
0°C	+1863.9 mV
-30°C	+2205 mV
-40°C	+2318 mV
-55°C	+2485 mV

Connection Diagrams

Note:

- GND (pin 2) may be grounded or left floating. For optimum thermal conductivity to the pc board ground plane pin 2 should be grounded.
- NC (pin 1) should be left floating or grounded. Other signal traces should not be connected to this pin.

Parameter	Conditions	Typical (Note 6)	LM20B	LM20C	LM20S	Units (Limit)
			Limits (Note 7)	Limits (Note 7)	Limits (Note 7)	
Temperature Coefficient of Quiescent Current		-11				nA/°C
Shutdown Current	$V_+ \leq +0.8 \text{ V}$	0.02				μA

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: When the input voltage (V_I) at any pin exceeds power supplies ($V_I < \text{GND}$ or $V_I > V_+$), the current at that pin should be limited to 5 mA.

Note 3: The human body model is a 100 pF capacitor discharged through a 1.5 k Ω resistor into each pin. The machine model is a 200 pF capacitor discharged directly into each pin.

Note 4: Reflow temperature profiles are different for lead-free and non-lead-free packages.

Note 5: The junction to ambient thermal resistance (θ_{JA}) is specified without a heat sink in still air using the printed circuit board layout shown in [Figure 1](#).

Note 6: Typical values are at $T_J = T_A = 25^\circ\text{C}$ and represent most likely parametric norm.

Note 7: Limits are guaranteed to National's AOQL (Average Outgoing Quality Level).

Note 8: Accuracy is defined as the error between the measured and calculated output voltage at the specified conditions of voltage, current, and temperature (expressed in $^\circ\text{C}$).

Note 9: Non-Linearity is defined as the deviation of the calculated output-voltage-versus-temperature curve from the best-fit straight line, over the temperature range specified.

Note 10: Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output due to heating effects can be computed by multiplying the internal dissipation by the thermal resistance.

Note 11: Negative currents are flowing into the LM20. Positive currents are flowing out of the LM20. Using this convention the LM20 can at most sink $-1 \mu\text{A}$ and source $+16 \mu\text{A}$.

Note 12: Load regulation or output impedance specifications apply over the supply voltage range of $+2.4\text{V}$ to $+5.5\text{V}$.

Note 13: Line regulation is calculated by subtracting the output voltage at the highest supply input voltage from the output voltage at the lowest supply input voltage.

Typical Performance Characteristics

PCB Layouts Used for Thermal Measurements

a) Layout used for no heat sink measurements.

b) Layout used for measurements with small heat sink.

FIGURE 1. PCB Layouts used for thermal measurements.

1.0 LM20 Transfer Function

The LM20's transfer function can be described in different ways with varying levels of precision. A simple linear transfer function, with good accuracy near 25°C, is

$$V_O = -11.69 \text{ mV/}^\circ\text{C} \times T + 1.8663 \text{ V}$$

Over the full operating temperature range of -55°C to +130°C, best accuracy can be obtained by using the parabolic transfer function.

$$V_O = (-3.88 \times 10^{-6} \times T^2) + (-1.15 \times 10^{-2} \times T) + 1.8639$$

solving for T:

$$T = -1481.96 + \sqrt{2.1962 \times 10^6 + \frac{(1.8639 - V_O)}{3.88 \times 10^{-6}}}$$

A linear transfer function can be used over a limited temperature range by calculating a slope and offset that give best results over that range. A linear transfer function can be calculated from the parabolic transfer function of the LM20. The slope of the linear transfer function can be calculated using the following equation:

$$m = -7.76 \times 10^{-6} \times T - 0.0115,$$

where T is the middle of the temperature range of interest and m is in V/°C. For example for the temperature range of $T_{\text{MIN}} = -30$ to $T_{\text{MAX}} = +100^\circ\text{C}$:

$$T = 35^\circ\text{C}$$

and

$$m = -11.77 \text{ mV/}^\circ\text{C}$$

The offset of the linear transfer function can be calculated using the following equation:

$$b = (V_{\text{OP}}(T_{\text{MAX}}) + V_{\text{OP}}(T) - m \times (T_{\text{MAX}} + T))/2$$

where:

- $V_{\text{OP}}(T_{\text{MAX}})$ is the calculated output voltage at T_{MAX} using the parabolic transfer function for V_O
- $V_{\text{OP}}(T)$ is the calculated output voltage at T using the parabolic transfer function for V_O .

Using this procedure the best fit linear transfer function for many popular temperature ranges was calculated in [Figure 2](#). As shown in [Figure 2](#) the error that is introduced by the linear transfer function increases with wider temperature ranges.

Temperature Range		Linear Equation $V_O =$	Maximum Deviation of Linear Equation from Parabolic Equation (°C)
T_{min} (°C)	T_{max} (°C)		
-55	+130	$-11.79 \text{ mV/}^\circ\text{C} \times T + 1.8528 \text{ V}$	±1.41
-40	+110	$-11.77 \text{ mV/}^\circ\text{C} \times T + 1.8577 \text{ V}$	±0.93
-30	+100	$-11.77 \text{ mV/}^\circ\text{C} \times T + 1.8605 \text{ V}$	±0.70
-40	+85	$-11.67 \text{ mV/}^\circ\text{C} \times T + 1.8583 \text{ V}$	±0.65
-10	+65	$-11.71 \text{ mV/}^\circ\text{C} \times T + 1.8641 \text{ V}$	±0.23
+35	+45	$-11.81 \text{ mV/}^\circ\text{C} \times T + 1.8701 \text{ V}$	±0.004
+20	+30	$-11.69 \text{ mV/}^\circ\text{C} \times T + 1.8663 \text{ V}$	±0.004

FIGURE 2. First order equations optimized for different temperature ranges.

2.0 Mounting

The LM20 can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface. The temperature that the LM20 is sensing will be within about $+0.02^{\circ}\text{C}$ of the surface temperature to which the LM20's leads are attached to.

This presumes that the ambient air temperature is almost the same as the surface temperature; if the air temperature were much higher or lower than the surface temperature, the actual temperature measured would be at an intermediate temperature between the surface temperature and the air temperature.

To ensure good thermal conductivity the backside of the LM20 die is directly attached to the pin 2 GND pin. The temperatures of the lands and traces to the other leads of the LM20 will also affect the temperature that is being sensed.

Alternatively, the LM20 can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LM20 and accompanying wiring and circuits must be kept insulated and dry, to avoid leakage and corrosion. This is especially true if the circuit may operate at cold temperatures where condensation can occur. Printed-circuit coatings and varnishes such as Humiseal and epoxy paints or dips are often used to ensure that moisture cannot corrode the LM20 or its connections.

The thermal resistance junction to ambient (θ_{JA}) is the parameter used to calculate the rise of a device junction temperature due to its power dissipation. For the LM20 the equation used to calculate the rise in the die temperature is as follows:

$$T_J = T_A + \theta_{JA} [(V^+ I_Q) + (V^+ - V_O) I_L]$$

where I_Q is the quiescent current and I_L is the load current on the output. Since the LM20's junction temperature is the actual temperature being measured care should be taken to minimize the load current that the LM20 is required to drive.

The tables shown in Figure 3 summarize the rise in die temperature of the LM20 without any loading, and the thermal resistance for different conditions.

	SC70-5 no heat sink		SC70-5 small heat sink	
	θ_{JA} ($^{\circ}\text{C}/\text{W}$)	$T_J - T_A$ ($^{\circ}\text{C}$)	θ_{JA} ($^{\circ}\text{C}/\text{W}$)	$T_J - T_A$ ($^{\circ}\text{C}$)
Still air	412	0.2	350	0.19
Moving air	312	0.17	266	0.15

See Figure 1 for PCB layout samples.

	micro SMD no heat sink		micro SMD small heat fin	
	θ_{JA} ($^{\circ}\text{C}/\text{W}$)	$T_J - T_A$ ($^{\circ}\text{C}$)	θ_{JA} ($^{\circ}\text{C}/\text{W}$)	$T_J - T_A$ ($^{\circ}\text{C}$)
Still air	340	0.18	TBD	TBD
Moving air	TBD	TBD	TBD	TBD

FIGURE 3. Temperature Rise of LM20 Due to Self-Heating and Thermal Resistance (θ_{JA})

3.0 Capacitive Loads

The LM20 handles capacitive loading well. Without any precautions, the LM20 can drive any capacitive load less than 300 pF as shown in Figure 4. Over the specified temperature range the LM20 has a maximum output impedance of 160 Ω . In an extremely noisy environment it may be necessary to add some filtering to minimize noise pickup. It is recommended that 0.1 μF be added from V^+ to GND to bypass the power supply voltage, as shown in Figure 5. In a noisy environment it may even be necessary to add a capacitor from the output to ground with a series resistor as shown in Figure 5. A 1 μF output capacitor with the 160 Ω maximum output impedance and a 200 Ω series resistor will form a 442 Hz lowpass filter. Since the thermal time constant of the LM20 is much slower, the overall response time of the LM20 will not be significantly affected.

10090815

FIGURE 5. LM20 with Filter for Noisy Environment and Capacitive Loading greater than 300 pF. Either placement of resistor as shown above is just as effective.

4.0 LM20 micro SMD Light Sensitivity

Exposing the LM20 micro SMD package to bright sunlight may cause the output reading of the LM20 to drop by 1.5V. In a normal office environment of fluorescent lighting the output voltage is minimally affected (less than a millivolt drop). In either case it is recommended that the LM20 micro SMD be

placed inside an enclosure of some type that minimizes its light exposure. Most chassis provide more than ample protection. The LM20 does not sustain permanent damage from light exposure. Removing the light source will cause LM20's output voltage to recover to the proper value.

FIGURE 7. Conserving Power Dissipation with Shutdown

10090828

Most CMOS ADCs found in ASICs have a sampled data comparator input structure that is notorious for causing grief to analog output devices such as the LM20 and many op amps. The cause of this grief is the requirement of instantaneous charge of the input sampling capacitor in the ADC. This requirement is easily accommodated by the addition of a capacitor. Since not all ADCs have identical input stages, the charge requirements will vary necessitating a different value of compensating capacitor. This ADC is shown as an example only. If a digital output temperature is required please refer to devices such as the LM74.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
